Naslov rada na
hrvatskom jeziku: **Willemsova fundamentalna lema s primjenama**Naslov rada na
engleskom jeziku: **Willems' Fundamental Lemma with Applications**

Opis zadatka:

Classical approach to simulation and controller design for dynamical systems is a model-based approach. A model of system's dynamics is obtained either directly by applying laws of physics on the considered system or indirectly via system identification. The latter is a data-based approach and the data, which consists of recorded input-output trajectories of the system, is used in a suitably defined optimization problem to obtain a model.

Alternative to model-based approaches is the direct data-based approach where simulations and/or controller synthesis is performed directly from data, completely avoiding a model. Such approach has gained significant attention in the control systems community over the past years. There are several reasons for that and the obvious one is that modern IT technologies enable collecting (sensing/recording) of large data sets in an inexpensive way. From a scientific point of view, the direct data-based approach is attractive as it can offer exact results with robustness guarantees, similar to the classical model-based approach.

One of the key results that has inspired and enabled a set of methods in direct data-based approach is the so-called Willems' fundamental lemma. Loosely speaking, this lemma states that all possible trajectories of a linear time invariant (LTI) dynamical system belong to an image space of a suitable defined data-based matrix. The main goal of this thesis is to summarize dominant state-of-the-art approaches to data-based simulation and controller design and to suitably illustrate them on several examples.

The thesis should contain the following:

- Presentation of the Willems' fundamental lemma together with discussion of its origins and meaning.
- Literature overview of the state-of-the-art results on data-based approaches which are based on the Fundamental lemma.
- On a set of suitably selected and designed examples illustrate some of the data-based approaches for simulation and control of LTI dynamical systems.
- Using suitable simulation tools (e.g., MATLAB/Simulink) to investigate applicability of the Fundamental lemma on nonlinear systems.

The thesis must contain the list of used literature as well as any assistance received.

Zadatak zadan:

22. 4. 2026.

Zadatak zadan:

Prof. dr. sc. Andrej Jokić

Datum predaje rada:

2. rok: 15. i 16. 7. 2026.

3. rok: 16. i 17. 9. 2026.

Predviđeni datumi obrane:

2. rok: 21. - 23. 7. 2026.

3. rok: 22. - 24. 9. 2026.

Predsjednik Povjerenstva:

izv. prof. dr. sc. Petar Čurković

SAŽETAK

Ovdje upišite sažetak rada na hrvatskom jeziku.

KLJUČNE RIJEČI: ključna riječ jedan; ključna riječ dva

Abstract

Write the thesis abstract in English here.

Keywords: keyword one; keyword two; keyword three

1 Introduction

Write the introductory chapter here. This section should introduce the topic, describe the motivation for the work, and define the scope of the thesis.

1.1 Motivation

Describe the background and motivation for the thesis.

1.2 Literature Overview

2 Theoretical Background

Write the theoretical background and related work here.

2.1 Basic Concepts

Introduce the concepts, notation, and assumptions used in the thesis.

3 Methodology

Describe the methods, models, implementation, experiments, or design procedure used in the thesis.

4 Results

Present and discuss the results of the thesis.

5 Conclusion

Summarize the main contributions, limitations, and possible directions for future work.
